

Good [morning/afternoon] everyone,
We are Team Game Changers.

My name is Mukul, team leader and backend developer.

Our Problem Statement ID is **25031**, and the title is **Crowdsourced Civic Issue Reporting and Resolution System**.

The theme of our project is **Clean and Green Technology**, and it falls under the **Software category**.

Now let me quickly explain the problem we are solving and how our solution helps.”

Slide 2 – Problem & Solution

👉 Script:

“In India, cities generate more than **1.5 lakh tons of waste daily**. Issues like potholes, garbage overflow, and broken streetlights are very common. These problems cause **accidents, health risks, pollution, and frustration**.

But existing apps are **slow, complex, and lack real-time tracking**, so citizens lose trust.

To solve this, we built **CivicConnect — Your City, Your Voice**.

It is a **mobile-first platform** where citizens can easily report problems using **photo, voice, or text**.

Reports are sent with **auto location**, managed with **rule-based routing and urgency detection**, and displayed in **heatmaps and smart analytics**.

Citizens also get **real-time tracking, notifications, and even rewards for reporting**.

Now I’d like to invite my teammate **[Garv]**, who is our **Frontend Developer**, to explain how we have used technology to build this solution.”

THANK YOU

SCRIPT FOR GARV RAJORA

Intro:

“Good morning everyone, My name is Garv Rajora and frontend developer

Slide 3: *Technical Approach*

“In this slide, we show the technologies and flow of our solution.

👉 **For Frontend** we uses HTML, CSS, and JavaScript for a simple, responsive interface.

👉 **For Backend** is built with Node.js and Express.js, with JWT authentication and Role-Based Access Control.

👉 **For Routing Logic** we uses rule-based algorithms to assign complaints correctly.

👉 **For Database** we use MongoDB with indexed tables for fast retrieval.

👉 **For Deployment**, we use Vercel/Netlify, and integrate **APIs** like Google Maps and REST APIs.

On the right, you can see the **mockup flow**: user reports an issue → submits details → admin receives and updates → finally, the user gets a resolved notification with feedback. This ensures a smooth and transparent process.”

Slide 4: *Feasibility & Viability*

👉 Under **Technical Feasibility**, our solution is lightweight because it is built with simple web technologies, integrated with location & mapping APIs, and designed to collaborate with local government and administrators.

👉 On the other hand, there are **Potential Challenges**, like performance & scalability issues when more users join, and ensuring secure payments & monetization in future versions.

👉 But we have clear **Strategies to Overcome** these challenges, like using image optimization and caching to handle performance, secure in-app payment methods, strong API and enterprise integration, and affordable data licensing.

So overall, our solution is not only technically strong but also feasible in real-world conditions.”

Now I'd like to invite my teammate **[Jiya Singhal]**, to explain the **imact and benefit**.

THANK YOU

SCRIPT FOR JIYA SINGHAL

Slide 5: Impact and Benefits

"Good [morning/afternoon] everyone. My name is Jiya Singhal and I'm a UI/UX Developer

👉 First, let's talk about the **Impact**:

- It ensures **faster complaint resolution, transparency in governance, citizen participation**
- And most importantly, it improves **accountability of government departments**.

👉 **Target Audience & Benefits**

- **For citizens**, it offers a quick and transparent way to raise complaints with photo/video proof, get real-time updates, and even earn reward points or digital badges.
- **For government staff and admins**, it streamlines complaint monitoring, task allocation, escalation, and provides zone-wise analytics for better governance.
- **For field workers**, it ensures clear task details with location and proof-based closure, increasing accountability and efficiency.

Slide 6: Research and References

"Moving to the next slide.

We have done proper **Research and References** to validate our idea. We studied existing reports, research papers, and feasibility analysis, which helped us understand gaps in the current solutions.

We compared our idea with existing apps like Swachhata App, Fix My Street, and Nagar Nigam App.

- Our solution covers more advanced features like **voice complaint, rule-based routing, gamification and rewards, analytics & reports, live map analytics, and chatbot integration**.
- Most other apps lack these features, making our solution more unique and impactful.

Thank you! "Every small report can create a big difference in society."
